

The natural characteristics of bamboo Outdoor products

Strands

Bamboo Decks and other outdoor products are made out of long bamboo fibre (strands). In rarely cases caused by mechanical impact or weathering, small areas i.e ribbled or or profiled surfaces , small parts of fibre strands could break and loose , just as with wood. By using the aMbooo special brush with cleaner and water or a small metal tool, small loose strand fibre pieces can be removed and sanded to make it smooth.

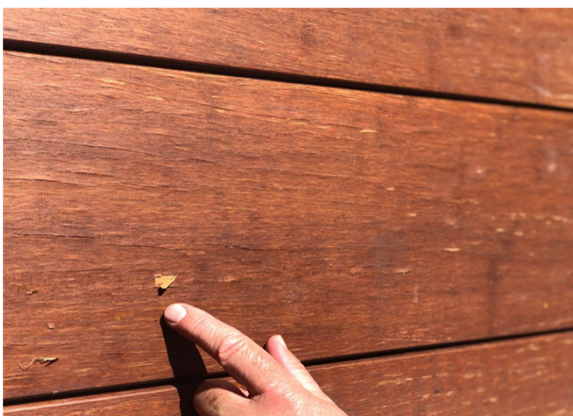

Cracks + Checks

Due to dry top surface and wet back sides, moistures changes due to wetaher condition ,change of temperature, tensions occure. One side wants to grow and the other side wants to shrink. This natural process leads to tension, this may lead to checks and cracks. Checks and cracks do not have a negativ impact on the structural stability or formstabilty. The cracks and checks change over the chear and period - just as the climate.

Strand peels

In rarely cases the material show small strand peels on the surface. It occurs if the yellow part of the bamboo fibre is exposed to the weatherig side. It has no negativ impact to the mechanical and technical properties of the board. It can be removed easily with a metal tool such as a small knife or screw driver. After sanding this area it can get smooth again.

Natural Greying

UV Light changes all natural surfaces including bamboo. In order to cease this change use aMbooo maintenance oil 1x year to stabilize the original color. Easy with aMbooo Applicator and extends the lifespan of the boards.
